Bug Report:

Login attempts counter does not match the actual lockout limit

Test object: Account Lockout

Environment: Android 16, Chrome

Preconditions:

1. The website is open
2. The user have a registered account with its true PIN

Steps:

1. Login screen.
2. Enter a wrong PIN.
3. Note the remaining-attempts message (2 remaining attempts).
4. Keep entering wrong PINs until the account is locked.

Expected Result:

1. The account should be blocked after 3 attempts only (counting from the first attempt before the message)

Actual Result:

1. The system accept the fourth try, so the account is blocked after 4 attempts not 3
