ATM Simulator - Exploratory Testing Session Log

Session duration: 30 minutes | Browser: Google Chrome | Browser Version: 155 | environment : Windows

4.1 Notes During Session

Time	Action	Observation	Issue?
00:00	Set up the testing environment on a PC using Google Chrome.	The environment was prepared to test the ATM Simulator. Chrome version: 155.0.859.84.	No
00:02	Explored the application header, system description, and available transaction buttons.	The page provided an overview of the system, mentioned HTML, CSS, and JavaScript, and introduced the available operations.	No
00:03	Inspected the ATM interface and its initial account input field.	The Account Number field appeared as a numeric spinner with increment and decrement arrows instead of a conventional text input.	UI observation
00:04	Tested the Account Number field using letters, special characters, and emojis.	The field did not accept these characters and was restricted to numeric input.	No
00:05	Tested empty input, a one-digit account number, a three-digit number, and other numeric values.	Empty input displayed a prompt to enter the account number. Invalid numbers produced an invalid-account message. Only recognized demo account numbers were accepted.	No
00:06	Tested the maximum length of the Account Number field.	The field allowed a maximum of eight digits. The spinner started from one, although the application required a recognized eight-digit account number.	UI observation
00:07	Entered the demo account number displayed on the page.	The application accepted the recognized demo account and proceeded to PIN entry.	No
00:08	Entered the correct demo PIN, 1234.	Authentication succeeded and a welcome message appeared. The PIN field contained four positions.	No
00:09	Inspected the Submit and Eject buttons and the transaction controls.	Transaction controls became available after authentication. Before login, the transaction controls were not available for interaction.	No
00:10	Opened Check Balance.	The screen displayed a balance of 5,000 in Indian currency, the account number, and a Back button.	No
00:11	Attempted to navigate to another transaction without pressing Back.	The application allowed navigation between transaction screens without returning to the main screen first.	Yes - BUG-001
00:12	Opened Mini Statement before performing a new transaction.	No transactions were displayed at that point.	No
00:13	Opened Cash Deposit and inspected the amount field.	The deposit amount was controlled by a numeric spinner rather than a conventional text input.	UI observation
00:14	Tested small deposit amounts, including 1 and 1.5, and other numeric values.	The input accepted small amounts and decimal values. No minimum deposit amount was established during this test.	Validation observation
00:15	Completed a deposit and checked the account balance.	The balance increased by the deposited amount.	No
00:16	Opened Mini Statement after the deposit.	The transaction history displayed the transaction with a date and time.	No
00:17	Changed the PC's system time and performed the same deposit test again.	The new transaction's displayed time reflected the device's changed time.	Yes - BUG-002

Time	Action	Observation	Issue?
00:18	Restored the PC's system time and performed another transaction.	The transaction timestamp continued to reflect the device's system time. The history included entries whose timestamps differed from the actual order in which the transactions were performed.	Yes - BUG-002
00:19	Opened Cash Withdrawal and inspected the withdrawal amount field.	The withdrawal control used a numeric spinner that increased the amount in increments of 100.	UI observation
00:20	Tested withdrawal boundary values, including zero, 99, 99.9, and 100.	The minimum withdrawal amount was displayed as 100. Values below 100, including 99.9, were rejected, while 100 was accepted and the withdrawal succeeded.	No
00:21	Entered alternative withdrawal amounts, including 200, 250, and decimal values.	The application allowed amounts other than multiples of 100, including decimal amounts. The spinner increment did not prevent other values from being entered.	Validation observation
00:22	Attempted to withdraw more than the available balance.	The application rejected the withdrawal.	No
00:23	Attempted to withdraw the entire available balance.	The withdrawal succeeded. The balance decreased accordingly, and the successful transaction appeared in Mini Statement.	No
00:24	Reviewed the transaction history after the withdrawal tests.	The successful withdrawal appeared in the transaction history. Whether rejected withdrawal attempts should also be recorded was not established.	Validation observation
00:25	Attempted to change the PIN to the same PIN already in use.	The application rejected the change and displayed a message indicating that the PIN already existed.	No
00:26	Entered different values in the new PIN and confirmation fields.	The application displayed a mismatch message when the two values did not match.	No
00:27	Entered letters and special characters in the Change PIN fields and submitted the change.	The application accepted the invalid character types and allowed the PIN change to proceed.	Yes - BUG-003
00:28	Exited the account and attempted to log in again using the changed value containing letters or special characters.	The PIN field did not accept letters or special characters. The previously configured PIN also did not allow login in the tested scenario.	Yes - BUG-003
00:29	Entered an incorrect PIN twice, then switched to another account.	The remaining-attempts message displayed a stale value from the previous account before the next PIN entry. The message updated after an incorrect attempt, and entering the correct PIN allowed login.	Yes - BUG-004
00:30	Concluded the exploratory testing session.	The session covered the environment, account validation, authentication, balance inquiry, deposit, withdrawal, transaction history, navigation, and PIN change.	No

4.2 Bugs Found

Bug ID	Description	Severity	Steps to Reproduce
BUG-001	Transaction screens allow direct navigation without returning to the main screen using Back.	Medium	1. Log in with a valid demo account. 2. Open Check Balance or Withdrawal. 3. Select another transaction directly. 4. Observe that navigation succeeds without pressing Back.
BUG-002	Transaction timestamps follow the PC's system time and may not reflect the actual transaction order.	High	1. Record the current system time. 2. Perform a transaction. 3. Change the PC's system time. 4. Perform another transaction. 5. Restore the original time and perform a third transaction. 6. Compare the displayed timestamps with the actual transaction sequence.
BUG-003	Change PIN accepts letters and special characters, but the login PIN field does not accept those same character types.	High	1. Log in with a valid demo account. 2. Open Change PIN. 3. Enter a PIN containing letters or special characters in the new PIN fields. 4. Submit the change. 5. Exit the account. 6. Attempt to log in using the changed value. 7. Observe the inconsistency between the PIN change and login input validation.
BUG-004	Remaining PIN attempts message displays stale information after switching accounts.	Low	1. Enter an incorrect PIN twice for an account. 2. Observe the remaining-attempts message. 3. Switch to another account. 4. Open PIN entry and observe the message before entering a PIN. 5. Enter an incorrect PIN and verify that the message updates. 6. Enter the correct PIN and verify successful login.

4.3 Coverage Notes

Area	Covered?	Notes
Test environment setup	Yes	PC environment prepared using Google Chrome 155.0.859.84.
Initial application exploration	Yes	Header, system description, and available transaction controls inspected.
Account Number validation	Yes	Empty, alphabetic, special-character, emoji, invalid numeric, and recognized demo account inputs explored.
Account Number length	Yes - Partial	Eight-digit maximum observed; other boundary and leading-zero scenarios were not established.
Account Number input control	Yes	Numeric spinner behavior and increment/decrement controls observed.
Valid PIN authentication	Yes	Correct demo PIN 1234 allowed login.
Invalid PIN handling	Yes	Incorrect PIN attempts produced remaining-attempts messages.
PIN attempts message across accounts	Yes - Partial	Stale UI message observed after switching accounts; backend lockout behavior was not fully investigated.
Check Balance	Yes	Balance of 5,000 in Indian currency displayed.
Transaction navigation	Yes - Partial	Direct navigation between transaction screens tested; expected behavior should be confirmed against the intended workflow.
Cash Deposit	Yes	Small amounts and decimal inputs tested; successful deposit increased the balance.
Deposit minimum and maximum limits	Partial	No minimum was established in the tested scenarios; the maximum limit was not determined.
Transaction history	Yes - Partial	Successful deposit and withdrawal transactions appeared with dates and times.
Transaction timestamp behavior	Yes - Partial	Changing the PC system time affected displayed transaction times.
Withdrawal minimum boundary	Yes	Zero, 99, 99.9, and 100 were tested. Values below 100 were rejected, and 100 was accepted.
Withdrawal amount increments	Yes	Spinner increased in increments of 100, while other amounts were also accepted.
Withdrawal decimal precision	Yes - Partial	Decimal values were accepted; the maximum supported number of decimal places and actual processing results require further verification.

Area	Covered?	Notes
Withdrawal above available balance	Yes	The application rejected the attempted withdrawal.
Withdrawal of full balance	Yes	The application allowed withdrawal of the available balance.
Mini Statement	Yes - Partial	Successful transactions were displayed. Recording of rejected attempts was not verified.
Change PIN - same PIN	Yes	Reusing the existing PIN was rejected.
Change PIN - mismatch validation	Yes	Different values in the PIN and confirmation fields produced a mismatch message.
Change PIN - character validation	Yes	Letters and special characters were accepted during PIN change, creating an inconsistency with login validation.
Re-login after PIN change	Yes - Partial	The changed value could not be entered in the login PIN field, and the previous PIN did not work in the tested scenario.
Eject / Exit	Yes - Partial	Exit was used before attempting to log in again; other Eject behavior was not explored.
